

## Land Analysis

**Note:** *Due to the fact that the top Land Analysis scientists were not available at the time, the Bureau of Land Colonisation and Progress (Bolcap), had to borrow the Music Board's CD stacker/cleaner to do the analysis.*

**Report:** Many deep scratches with moving clear liquid can be seen all across the surface of the land. The land is black and rough, resembling the surface of a well-used vinyl record.

When visiting the land, loud, husky, scratchy singing voices can be heard, replicating the sound of a good CD being played through bad, cheap speakers.

My superiors and I witnessed colourfully dressed people moving quickly to a continuous noise through the bushland. Unusually, the sound does not get louder as the subject in question approaches the well-made and configured speakers; the sound stays the same volume always.

The people scream out to the sky (or to be more exact, the sun), "Thank you Ra." Such a picture of that moment would be appropriate for the album cover of a band made up of four members called the Beatles. Song: 'Here Comes the Sun.'
